
Product-source diagnostic: predictive weights and their limits
A Paired weights on identifiable prefixes
Mean predictive weight
Observed prefix length
Bayes: any copy
Transformer: any copy
Bayes: both copy
Transformer: both copy
B Prediction discrepancy: all source draws
KL(transformer || prediction) [bits]
Observed prefix length
Four-component fit
Family Bayes
C Identification and robust status coverage
Fraction of all declared source draws
Observed prefix length
Component-identifiable
Robust CC / non-CC
Robust CC uniquely largest
D First observed non-CC to CC-largest intervals
Predeclared source draw
Observed prefix length
Bayes canonical
Transformer robust
32 independent 8 x 8 source draws; one fixed checkpoint. Shading: one source standard error. Identification: sigma >= 0.02; robustness epsilon = 0.001.
D: resolved intervals, not confidence intervals; Bayes and robust transformer intervals use different criteria. Ring: later return to non-CC; x: no switch.
